

One access technology that has proven its effectiveness in the learning arena is Communication Access Realtime Translation, or CART. CART is a word-for-word translation of the spoken word into text. All of the spoken words are presented for people who are Deaf or hard of hearing, uncensored, at amazing speeds. Whether the word-for-word text is used for one student or is projected on a large screen for all to see, CART is an access technology for all ages and grades. CART can also be provided remotely. Remote CART is unobtrusive for the student and is very easy to set up. This is truly a global access technology.

The main goal for access technology is the success of your students. CART offers a level of access to education that is the foundation for their success. It supports students from the beginning of their education, assisting with reading, grammar and punctuation skills, all the way through to the world of work. Successful students equal successful institutions. The audience will learn about CART philosophy, hardware and technology options as well as see a demonstration of remote CART; CART is a tool for student success, one word at a time.
